Epilepsy is a common neurological disorder that affects people of all ages. It is characterized by recurrent seizures, which are sudden, uncontrolled bursts of electrical activity in the brain. Seizures can vary in severity, from brief episodes of staring or twitching to prolonged convulsions that can lead to unconsciousness.

Epilepsy can be caused by a variety of factors, including:

- Head trauma
- Stroke
- Brain tumors
- Genetic disorders
- Developmental abnormalities

The diagnosis of epilepsy is based on a detailed history of the patient's seizures and a physical examination. Electroencephalography (EEG) is a diagnostic test that can help to confirm the diagnosis of epilepsy and identify the type of seizure disorder.

The treatment of epilepsy depends on the type of seizure disorder and the severity of the seizures. Treatment options include medication, surgery, and neuromodulation.

Epilepsy: An Issue of Neurosurgery Clinics provides a comprehensive review of the latest advances in the surgical management of epilepsy. The issue editors, Drs. Daniel Curry, Gregory Cascino, and Theodore Schwartz, have assembled a panel of leading experts in the field to provide up-to-date reviews on the most important topics in epilepsy surgery.

This authoritative guide covers a wide range of topics, including:

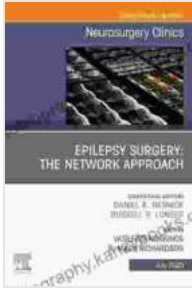

- The evaluation of patients with epilepsy for surgical treatment
- The surgical management of focal epilepsy
- The surgical management of generalized epilepsy
- The use of neuromodulation for the treatment of epilepsy
- The complications of epilepsy surgery

Epilepsy: An Issue of Neurosurgery Clinics is an essential resource for neurosurgeons, neurologists, and other healthcare professionals who provide care for patients with epilepsy.
