Description

This book is a comparative study of the concept of the atom in Jain philosophy and modern science. The author, J. V. Bhatia, argues that there are striking similarities between the two traditions, despite the fact that they

developed independently of each other. Bhatia examines the concept of the atom in both Jainism and modern science, and he discusses the implications of these similarities for our understanding of the nature of reality.

Bhatia begins by introducing the basic concepts of Jain philosophy. He then discusses the concept of the atom in Jainism, and he argues that the Jain concept of the atom is remarkably similar to the modern scientific concept of the atom. Bhatia then examines the implications of these similarities for our understanding of the nature of reality.

Bhatia concludes by arguing that the similarities between the concept of the atom in Jain philosophy and modern science provide evidence for the existence of a common underlying reality. He argues that this common underlying reality is the source of both the Jain and the modern scientific concepts of the atom.
